The building1.txt file and building2.txt file has age of people who are located in a two apartments. The government has approved vaccine for COVID 19 for each apartment in Doha. The first batch of vaccine is allotted to apartments, which has an average age greater than 50.

 Read the ages in the both the text files separately and find the averages.

Pass the average to a function allot_vaccine(average1,average2) which should print out whether the vaccine should be allotted to building 1 or building 2.
